in recent decades p -adic geometry and p -adic cohomology theories have become indispensable tools in number theory algebraic geometry and the theory of automorphic representations the arizona winter school 2007 on which the current book is based was a unique opportunity to introduce graduate students to this subject following invaluable introductions by john tate and vladimir berkovich two pioneers of non archimedean geometry brian conrad's chapter introduces the general theory of tate's rigid analytic spaces raynaud's view of them as the generic fibers of formal

schemes and berkovich spaces samit dasgupta and jeremy teitelbaum discuss the p adic upper half plane as an example of a rigid analytic space and give applications to number theory modular forms and the p adic langlands program matthew baker offers a detailed discussion of the berkovich projective line and p adic potential theory on that and more general berkovich curves finally kiran kedlaya discusses theoretical and computational aspects of p adic cohomology and the zeta functions of varieties this book will be a welcome addition to the library of any graduate student and researcher who is interested in learning about the techniques of p adic geometry book jacket

contains research articles on linear algebra with emphasis on applications and numerical procedures these applications include such areas as markov chains networks signal processing systems and control theory mathematical programming economic and biological modeling and statistics and operations research
